FOUNDER INTELLIGENCE

Full Product Bible

BUILT BY

DEZAI Technologies × The First Brick Community

LAUNCH MARKETS

Dubai / UAE • India • designed for global expansion

Research the market.

Challenge the idea.

Find the gap.

Prove what matters.

Decide what to build.

PRODUCT • RESEARCH • AI • DATA • UX • BUSINESS • ROADMAP

0. Document Control

Field	Definition
Product	Founder Intelligence (FI)
Built by	DEZAI Technologies × The First Brick Community
Launch markets	Dubai / UAE and India
Category	AI-native market intelligence and founder decision platform
Primary users	Founders, aspiring founders, student entrepreneurs, product builders, innovation teams, consultants and incubators
Core promise	Turn an idea or business question into evidence-backed market understanding and a clear next action
Primary output	Decision-grade intelligence, not merely a generic AI answer or static business plan
Product principle	Evidence before confidence. Recommendations must be traceable to evidence, assumptions and reasoning.
Document status	Master product bible / strategic specification

Important: This document is a product definition and strategic blueprint. Some future capabilities are intentionally described as roadmap targets rather than claims that they already exist in the current build.

The master reference for what FI is, why it exists, what it does, how it works, who it serves, and how it should evolve. Founders, aspiring founders, student entrepreneurs, product builders, innovation teams, consultants and incub Important: This document is a product definition and strategic blueprint.

Some future capabilities are intentionally described as roadmap targets rather than claims that they already exist in the current build.

1. Table of Contents

A clean chapter-by-chapter map of the full FI product strategy.

2. Executive definition
3. The problem FI is solving
4. Why this problem matters
5. FI's purpose
6. Who FI is for
7. Core user journeys
8. What FI actually does

2. Executive Definition

Founder Intelligence is an AI-native market intelligence and decision platform designed to help founders answer the questions that matter before and while building a company: Is this problem real? Who cares? How large or attractive is the opportunity? What alternatives already exist? What are customers saying? What are competitors changing? What can we charge? How can we reach customers? What assumptions are still unproven? What should we test next?

FI is intentionally broader than an idea validator and more decision-oriented than a generic research chatbot. Its long-term role is to become a founder's intelligence layer: a persistent system that remembers the business context, gathers evidence, maps the market, challenges assumptions, recommends experiments, tracks changes and helps the founder update decisions over time.

North-star definition: FI helps a founder move from uncertainty to an evidence-backed decision.

The product should feel less like asking an AI for a report and more like having a research team, market analyst, customer researcher, competitive intelligence analyst and strategic advisor operating inside one continuously updated workspace.

The strongest version of FI is not a report generator. It is a decision system.

Current market research is increasingly fragmented across web research, competitive intelligence, social listening, digital demand analysis, customer research and specialized validation products.

3. The Problem FI Is Solving

Founder question	Typical current problem	FI response
Is the problem real?	Search results and anecdotes are disconnected.	Collect customer language, pain signals, reviews, communities and evidence.
Who is the real customer?	Personas are often invented before evidence exists.	Build an evidence-backed ICP and segment map.
Who are the competitors?	Google-style searches miss substitutes and emerging players.	Map direct, indirect, substitute and emerging competition.
Is demand increasing?	Trends are viewed as isolated charts.	Combine search, discussion, product and industry signals.
Can I charge?	Pricing is guessed or copied.	Compare competitor pricing, packaging and willingness-to-pay signals.
What is the gap?	Feature lists become superficial SWOT analysis.	Identify unmet jobs, complaints, workarounds and whitespace.
What should I build first?	Founders jump from research to feature lists.	Translate evidence into hypotheses, experiments and MVP priorities.
Can I trust the answer?	AI can blend fact and inference.	Separate evidence, inference, assumption and recommendation.
What changed since last month?	Research becomes stale after the report.	Continuous radar and change monitoring.

Starting a business requires a founder to make decisions before they have complete information. The problem is not simply lack of data. The problem is fragmented, noisy, stale and difficult-to-interpret information.

4. Purpose

FI exists to reduce avoidable uncertainty in business building. It does not promise certainty or guarantee startup success. Instead, it improves the quality, speed and traceability of the decisions a founder makes.

Make serious market research accessible without requiring a dedicated analyst team.

Replace random browsing with a structured research process.

Turn scattered public evidence into an understandable market model.

Challenge founder assumptions instead of simply agreeing with them.

Expose contradictions and missing evidence.

Connect research findings to decisions and experiments.

Keep research alive after the first report through monitoring.

Create a persistent intelligence history for each business idea.

Help founders explain why they believe a market decision is reasonable.

Support both early-stage exploration and ongoing product strategy.

FI should never position itself as an oracle. Its value is disciplined uncertainty reduction.

5. Who FI Is For

Segment	Primary need	FI value
First-time founder	Know whether to pursue an idea	Structured validation, market map, competitors, customer evidence and next tests
Serial founder	Compare multiple opportunities quickly	Idea portfolio, opportunity scores, research history and decision memory
Student entrepreneur	Learn how real startup research works	Guided interview, plain-language research and experiment planning
Product builder	Choose what to build next	Customer signals, competitor gaps, pricing, demand and product strategy
Consultant / advisor	Produce research faster	Repeatable research workflows, evidence trace and exports
Incubator / accelerator	Evaluate many ideas	Standardized intelligence, scorecards and cohort-level insight
Innovation team	Understand emerging opportunities	Trend radar, market mapping and competitive monitoring
Investor / mentor	Stress-test founder thinking	Investor mode, assumptions, evidence coverage and risk view

6. Core User Journey

The canonical FI journey is intentionally adaptive. A founder should not have to know the perfect research framework before starting.

1. Create workspace
2. Describe idea, problem, customer or market in plain language
3. FI asks adaptive questions
4. FI converts answers into a structured research brief
5. User selects research depth and geography
6. Research planner creates investigation tasks
7. Search and source agents gather evidence
8. Evidence is classified and linked to claims
9. FI builds market, customer and competitor intelligence
10. FI calculates opportunity and evidence-coverage views
11. FI identifies assumptions, contradictions and unknowns
12. FI recommends validation experiments
13. Founder makes a decision
14. Decision is stored with its evidence and assumptions
15. Market Radar monitors meaningful changes
16. New evidence can trigger a decision review

The loop: Idea → Interview → Research Plan → Evidence → Intelligence → Score → Assumptions → Experiments → Decision → Monitoring → New Evidence → Updated Decision.

7. What FI Actually Does

Module	What it does
Idea Intake	Turns a rough idea into a structured business problem, customer, market and research brief.
Adaptive Interview	Asks only the questions needed to reduce ambiguity and expose assumptions.
Market Map	Defines category, segments, geography, demand drivers, trends, substitutes and market structure.
Customer Intelligence	Finds customer language, complaints, jobs, alternatives, buying signals and segment differences.
Competitive Intelligence	Maps competitors, substitutes, pricing, positioning, products, reviews, changes and whitespace.
Demand Intelligence	Studies demand signals, search patterns, communities, product activity and trend movement.
Pricing Intelligence	Benchmarks pricing models, packaging, tiers and observed willingness-to-pay evidence.
GTM Intelligence	Analyzes channels, distribution patterns, acquisition paths, partnerships and positioning.
Opportunity Score	Scores opportunity dimensions while exposing evidence coverage and uncertainty.
Assumption Ledger	Stores what must be true for the business thesis to work.
Experiment Lab	Turns assumptions into prioritized real-world tests.
Decision Trace	Connects decisions to assumptions, evidence, analysis and recommendations.
Founder Copilot	Lets the founder interrogate the entire project context conversationally.
Market Radar	Monitors relevant changes after the initial research.
Research Reports	Generates structured, source-linked decision documents.
Investor Mode	Reframes the same intelligence around investment questions and risk.
Workspace & History	Stores ideas, research, decisions, versions and team collaboration.

8. Adaptive Founder Interview

The onboarding interview is one of FI's most important differentiators. A static form creates friction and often asks questions that are irrelevant. FI should behave like an intelligent discovery interviewer.

Opening: "Tell me what you're thinking about building, in your own words." FI then identifies missing variables such as customer, geography, problem severity, current alternatives, business model, distribution, stage and evidence already known.

Example adaptive branches:

If the founder says "small businesses," FI asks which size, industry and geography matter.

If the founder says "people struggle with X," FI asks how the founder knows and what people do today.

If a competitor is named, FI asks what the founder believes is different.

If the idea is B2B, FI asks who experiences the pain, who buys and who approves.

If the idea is consumer, FI explores frequency, emotional/job-to-be-done, alternatives and acquisition.

If the founder has already interviewed customers, FI asks for transcripts or notes.

If the founder has no evidence, FI marks the claim as an assumption rather than a fact.

Output: Research Brief = Problem + Customer + Geography + Category + Alternatives + Business Model + Differentiation + Known Evidence + Unknowns + Research Questions.

9. Research Engine

Stage	Function	Output
Scope	Understand the founder question and research objective.	Research brief
Plan	Break the objective into evidence-seeking tasks.	Research plan
Discover	Search broadly across relevant source classes.	Candidate sources
Extract	Extract facts, quotes, numbers and claims.	Evidence objects
Cross-check	Compare independent sources and contradictions.	Validated / conflicting evidence
Synthesize	Interpret evidence in context.	Insights
Score	Apply transparent decision models.	Opportunity / risk views
Recommend	Translate evidence into actions or experiments.	Recommendations
Trace	Link recommendations to evidence and assumptions.	Decision trace
Monitor	Watch for meaningful changes.	Radar alerts

A strong research engine must also know when not to make a claim. Lack of evidence is itself a research state.

FI should use a multi-stage research pipeline rather than a single giant prompt.

A strong research engine must also know when not to make a claim. Lack of evidence is itself a research state.

10. Evidence Architecture

State	Meaning	Example
Verified	Directly supported by a reliable source or user-provided evidence.	Competitor's current public pricing page
Supported	Supported by multiple relevant sources with reasonable agreement.	Repeated customer complaint across several independent reviews
Directional	A meaningful signal exists but evidence is incomplete.	Growing discussion volume around a problem
Conflicting	Sources disagree or data points point in different directions.	Two sources report different market size estimates
Inferred	AI has derived a conclusion from evidence.	This segment may have higher urgency
Assumption	A founder or FI hypothesis that requires testing.	Customers will pay \$20/month
Unverified	Claim has not yet been sufficiently supported.	There are no competitors

Every important claim should ideally retain: source URL, source title, publisher, publication date if available, access date, source type, extracted passage or data, confidence, recency, independence, related claims and contradiction links.

FI's trust layer should explicitly distinguish what is known from what is inferred.

Every important claim should ideally retain: source URL, source title, publisher, publication date if available, access date, source type, extracted passage or data, confidence, recency, independence, related claims and contradiction links.

11. Market Intelligence

FI should answer the market questions behind the idea, not simply return a TAM number.

Category definition and adjacent categories

Market structure and value chain

Geographic scope

Customer segments

Demand drivers

Growth indicators

Technology shifts

Regulatory or policy factors where relevant

Macro and industry forces

Market maturity

Substitutes and non-consumption

Emerging categories

Key market narratives

Market-size estimates with methodology and source quality

Contradictory estimates and why they differ

Market sizing should show methodology. If only a third-party estimate exists, FI should label it as such rather than manufacturing a precise number.

12. Customer Intelligence

Customer intelligence answers: Who has the problem, how severe is it, what do they do today, what language do they use, and what might make them change?

ICP definition

Segment comparison

Jobs-to-be-done

Pain points

Desired outcomes

Existing workarounds

Switching triggers

Objections

Buying criteria

Decision makers and influencers

Review sentiment

Community discussion themes

Interview transcript analysis

Feature requests

Unmet needs

Language and messaging opportunities

Long-term, FI should allow founders to upload interviews and compare what customers actually said against the assumptions stored in the project.

13. Competitive Intelligence

Class	Meaning
Direct	Solves substantially the same problem for a similar customer.
Indirect	Solves the same underlying need differently.
Substitute	A different behavior or product customers can use instead.
Emerging	New entrant or adjacent product showing relevant movement.
Internal / DIY	Spreadsheet, manual process, employee or internal workaround.

FI should treat “competitor” as a broad strategic concept. For each meaningful competitor, FI can maintain a living profile: company, product, customer, geography, positioning, features, pricing, packaging, reviews, distribution, funding where relevant, notable changes, strengths, weaknesses supported by evidence, and strategic implications.

Competitive gap analysis should focus on customer-validated whitespace, not arbitrary feature gaps. A competitor lacking a feature does not automatically mean the market wants it.

14. Demand and Trend Intelligence

FI should combine multiple demand signals instead of treating one trend chart as proof.

Search interest

Community discussion

Review volume and language

Product launches

GitHub or developer activity where relevant

Funding activity where relevant

Job postings or hiring signals where relevant

News and industry developments

Competitor launches and positioning changes

Technology adoption signals

Customer questions and recurring pain themes

Each signal should be tagged by source quality, time period and relevance. A rising conversation is a signal, not automatically a market.

15. Pricing Intelligence

Pricing is a strategic decision. FI should help founders understand the pricing landscape before suggesting a number.

Competitor price points

Free vs paid structures

Per-seat, usage, transaction, subscription and one-time models

Feature packaging

Enterprise tiers

Geographic pricing where visible

Observed discounts and promotions

Customer willingness-to-pay evidence

Price objections from interviews/reviews

Value metric analysis

Potential pricing hypotheses

FI should present pricing recommendations as hypotheses with rationale, not as a magically correct price.

16. Go-to-Market Intelligence

FI should connect market research to the practical question: how could this business acquire its first customers?

Likely acquisition channels

Where the target customer already gathers

Search and content opportunities

Communities and partnerships

Outbound patterns

Marketplace or platform distribution

Sales cycle indicators

Trust requirements

Buyer objections

Positioning options

Messaging themes derived from customer language

Channel experiments

17. Opportunity Intelligence Score

Dimension	Question
Problem severity	Is the problem meaningful enough to motivate action?
Market attractiveness	Is there a sufficiently attractive market context?
Customer willingness	Is there evidence customers may pay, switch or engage?
Competitive pressure	How difficult is the competitive landscape?
Differentiation	Is there a credible reason to choose this solution?
Timing	Why now? Are there favorable or unfavorable shifts?
Monetization	Can value plausibly translate into revenue?
Distribution feasibility	Can the target customer realistically be reached?
Defensibility	Could the business develop durable advantage?
Execution fit	Does the founder/team have a realistic path to execute?

Every score should show confidence and evidence coverage. Example: 7.8/10 opportunity attractiveness, 62% evidence coverage. The second number prevents a high-looking score from being mistaken for high certainty.

The FI score should never be a fake measure of startup success. It is a structured decision aid that exposes the dimensions behind an opportunity.

Every score should show confidence and evidence coverage. Example: 7.8/10 opportunity attractiveness, 62% evidence coverage. The second number prevents a high-looking score from being mistaken for high certainty.

18. Assumption Ledger and Hypothesis

Assumption type	Example
Customer	Independent clinics experience this problem frequently.
Problem	The problem is painful enough to trigger action.
Behavior	Customers currently use a workaround.
Value	The proposed solution creates measurable value.
Willingness-to-pay	Customers will pay within a target range.
Distribution	A reachable channel exists.
Differentiation	The product can be meaningfully different.
Retention	The problem repeats often enough to support retention.
Execution	The team can build and operate the solution.

Each assumption receives status: unverified → testing → supported → weakened → rejected → accepted with confidence. This becomes the memory system behind FI's decision intelligence.

System Every business thesis contains things that must be true. FI should make these explicit.

Each assumption receives status: unverified → testing → supported → weakened → rejected → accepted with confidence. This becomes the memory system behind FI's decision intelligence.

19. Experiment Lab

Experiment	Best for
Customer interviews	Problem severity, language, context, buying criteria
Landing page	Message resonance and interest
Waitlist	Early demand signal
Price test	Pricing sensitivity
Concierge MVP	Value delivery before automation
Prototype test	Usability and desirability
Competitor-switch test	Reasons customers would switch
Channel test	Acquisition feasibility
Pre-order / commitment	Stronger willingness-to-pay evidence

FI should rank experiments by expected learning × decision impact ÷ cost/time. The goal is not to generate more tasks. It is to reduce the most important uncertainty.

Research tells a founder what might be true. Experiments create stronger evidence.

FI should rank experiments by expected learning × decision impact ÷ cost/time. The goal is not to generate more tasks. It is to reduce the most important uncertainty.

20. Decision Trace

A founder should be able to open a recommendation and ask: “Why did FI tell me this?” Example chain:

Recommendation: Test a \$19-\$29 monthly pricing hypothesis.

Because: Several competitors cluster around comparable value tiers and customer evidence suggests recurring use.

Evidence: Linked competitor pricing + customer statements + product usage assumptions.

Assumption: Target customers perceive the problem as recurring and costly.

Risk: Evidence is mostly secondary and willingness-to-pay has not yet been directly tested.

Experiment: Run 10 pricing interviews plus a landing-page price test.

Decision trigger: If fewer than X% show willingness at the target range, revisit packaging or segment.

This traceability is central to FI's identity. The platform should not hide reasoning behind a polished score.

21. Founder Copilot

Founder Copilot is the conversational layer over the structured intelligence system. It should know the current idea, research, evidence, assumptions, decisions, experiments and history.

"What are the three biggest reasons this idea could fail?"

"Which assumptions are still unsupported?"

"Show me competitors that serve the same job differently."

"What are customers complaining about most?"

"What changed in this market this month?"

"If we target India first, what changes?"

"What should I test before spending money on development?"

"Challenge my current thesis."

"Summarize the evidence for and against this decision."

Copilot response structure should default to: Answer → Evidence → Uncertainty → Implication → Suggested next step.

22. Continuous Market Radar

Radar	Monitors
Competitor	Pricing, launches, positioning, product pages, major strategic changes
Customer	New recurring complaints, needs and language
Demand	Meaningful movement in demand signals
Technology	New technology affecting product feasibility or category economics
Regulatory	Relevant policy or regulatory changes
Funding	Major funding or consolidation events where relevant
Category	New entrants and category shifts

Every alert should answer three questions: What changed? Why does it matter? What should I consider doing?

The first research report should not be the end of the relationship. Markets change.

Every alert should answer three questions: What changed? Why does it matter? What should I consider doing?

23. Research Report System

FI reports should be modular and evidence-linked. The user should be able to generate a quick brief or a deep research dossier without changing the underlying intelligence model.

Executive verdict

Idea and problem definition

Customer / ICP analysis

Market landscape

Market sizing and methodology

Demand signals

Customer intelligence

Competitive landscape

Competitor profiles

Feature / job gap map

Pricing intelligence

GTM intelligence

Opportunity score

Assumption ledger

Risk register

Contradictions and unknowns

MVP strategy

Validation experiments

Decision recommendations

Evidence appendix

Decision trace

Export targets can include PDF, Word and presentation formats. The report should retain source links and confidence labels wherever practical.

24. Investor Mode

Investor Mode does not pretend to replace due diligence. It changes the lens of the same underlying intelligence.

Market attractiveness

Growth and timing

Competition and differentiation

Customer evidence

Business model

Unit-economics assumptions

Distribution

Moat / defensibility

Key risks

Unresolved questions

Evidence quality

Founder-market fit evidence where user-provided information supports it

The strongest investor output is a risk and evidence memo, not an automatically flattering pitch deck.

25. Product Strategy and MVP

Planning FI should not jump all the way into the implementation-heavy capabilities of an enterprise solution builder. Its core job is intelligence before implementation. FI can still translate validated research into product strategy: target segment, core job, MVP hypothesis, feature priorities, value proposition, positioning, experiment plan and launch sequence.

Boundary principle: FI owns “Should we build, for whom, why, and what should we test?” A downstream solution-architecture system can own “How exactly should the enterprise system be implemented?”

26. Workspace, History and

Collaboration

Authentication

User profile

Workspace creation

Multiple business ideas

Research history

Version history

Saved evidence

Saved decisions

Assumption ledger

Experiment history

Team members

Comments and review

Export/share

Notifications

Activity log

Usage and billing

A user's research history is not merely an archive. Over time it becomes part of FI's intelligence advantage: what the founder believed, what evidence changed, what was tested and what happened.

27. Trust, Safety and Research Quality

Because FI influences business decisions, trust is a product feature.

Never invent sources.

Never fabricate competitor weaknesses.

Do not present estimates as facts.

Label assumptions and inferences.

Show conflicting evidence.

Prefer primary sources when available.

Record source dates and freshness.

Do not hide uncertainty behind a single score.

Make recommendations proportional to evidence.

Allow users to inspect supporting evidence.

Protect uploaded documents and private research.

Separate public research from private workspace data.

Provide deletion and export controls.

Avoid exposing sensitive personal data unnecessarily.

Quality gate: before an important recommendation is shown, FI should ask internally: What evidence supports this? How recent is it? Is it independent? What contradicts it? What remains unknown?

28. AI Architecture

Layer	Responsibility
Web / app	Next.js interface, authentication, dashboard, reports, copilot
Auth	Supabase Auth or equivalent
Data	PostgreSQL / Supabase
Research orchestrator	Creates plans, schedules tasks and coordinates agents
Search layer	Web search, targeted source discovery and retrieval
Extraction	Claims, facts, quotes, prices, entities, dates and source metadata
Evidence graph	Links sources → evidence → claims → insights → assumptions → decisions
Reasoning	Synthesizes evidence into insights and recommendations
Scoring	Deterministic calculation layer for transparent metrics
Model router	Routes extraction, classification and deep reasoning to appropriate models
Scheduler	Runs monitoring jobs and radar checks
Exports	PDF / Word / presentation outputs
Analytics	Product usage, research quality, cost and engagement

29. Data Architecture

Entity	Key fields / relationships
User	id, profile, plan, preferences
Workspace	owner, members, business context
Idea	problem, customer, category, geography, stage, status
ResearchProject	idea, scope, objectives, depth, status
ResearchQuestion	question, priority, evidence target
Source	url, title, publisher, date, source type, freshness
Evidence	source, extracted text/data, confidence, relevance
Claim	statement, evidence links, status
Insight	synthesis of claims and evidence
Competitor	entity profile, products, pricing, evidence
CustomerSegment	ICP, jobs, pain, buying criteria, evidence
Signal	type, time, strength, source
Assumption	statement, importance, status, evidence
Hypothesis	testable proposition, success criteria
Experiment	method, cost, expected learning, result
Decision	choice, rationale, evidence, assumptions
Recommendation	action, rationale, confidence
Alert	change, importance, affected object
Report	sections, sources, version

30. Search and Source Strategy

Source class	Best for
Official company/product sites	Current product, pricing, positioning, feature claims
Government / regulators	Policy, official statistics, regulation
Company filings / official reports	Financial and corporate facts
Academic research	Scientific or methodological evidence
Customer reviews	Pain points, satisfaction, feature language
Communities	Unfiltered problems, workarounds, language and emerging needs
Search trends	Directional demand movement
Industry reports	Category context and market estimates
News	Events, launches, funding, market changes
Job postings	Hiring and capability signals where relevant
Developer ecosystems	Technology adoption and technical demand

FI should use source classes appropriate to the question. No single source type is enough for the entire system. Current 2026 market coverage reinforces that market intelligence is assembled from multiple signal classes including customers, competitors, websites, social content, industry databases and financial sources. [\[cite\turn0search0\turn0search2\]](#)

31. Model Strategy

FI should avoid using the most expensive reasoning model for every operation.

Fast model: classification, tagging, extraction, summarization and routing.

Strong reasoning model: synthesis, contradiction analysis, strategy and complex recommendations.

Embedding / retrieval model: semantic search over project evidence.

Deterministic code: scoring, calculations, permissions, billing and validation.

Search / retrieval systems: source discovery and evidence retrieval.

Human-in-the-loop: important user decisions, uploaded interviews and sensitive strategic conclusions.

The model router should optimize for quality × latency × cost, not simply model prestige.

32. UX and Visual Product Direction

FI should feel like a premium intelligence instrument, not an academic database.

Dark and light themes

Subtle 3D depth

Glass surfaces used selectively

Editorial research typography

Strong hierarchy

Animated evidence connections

Interactive market maps

Visual competitor matrices

Confidence and evidence indicators

Smooth transitions between research stages

Minimal cognitive overload

Founder-friendly language

Power-user depth behind progressive disclosure

Visual principle: complexity should exist in the system, not in the user's first interaction.

33. Screens and Information

Screen	Purpose
Landing	Explain the problem, promise, workflow and credibility.
Pricing	Show research depth and value, not arbitrary message limits.
Login / Signup	Account creation and access.
Welcome	Introduce FI and start first idea.
Adaptive Interview	Conversational discovery.
Research Setup	Scope geography, audience, depth and goals.
Research Live	Show progress and research stages without exposing noisy internals.
Intelligence Home	Executive dashboard for the project.
Market Map	Market structure, segments, trends and context.
Competitors	Competitive landscape and detailed profiles.
Customers	ICP, pain, language, reviews and interview evidence.
Evidence	Claims, sources, confidence and contradictions.
Scorecard	Opportunity dimensions and evidence coverage.
Assumptions	What must be true.
Experiments	What to test next.
Decision Trace	Why a recommendation exists.
Radar	What changed.
Copilot	Ask questions about the whole project.
Reports	Generate and export intelligence.
History	Compare previous research and decisions.
Workspace	Team and collaboration.

Architecture

34. Pricing and Business Model

Tier	Potential role
Free / Explorer	Limited validations, basic market snapshot and guided first research.
Founder	Deeper research, saved projects, reports and more evidence.
Builder / Pro	Advanced intelligence, competitor monitoring, experiments and radar.
Team	Multiple seats, shared workspaces, collaboration and exports.
Enterprise	Security, governance, integrations, custom intelligence and support.

Pricing numbers should be finalized after testing willingness-to-pay in Dubai/UAE and India. The current product strategy intentionally leaves exact pricing flexible.

The product should monetize research depth, monitoring value, collaboration and intelligence continuity rather than raw chatbot messages.

Pricing numbers should be finalized after testing willingness-to-pay in Dubai/UAE and India. The current product strategy intentionally leaves exact pricing flexible.

35. Competitive Landscape

Category	Examples	Typical strength
General AI research	Perplexity and similar tools	Fast broad web research
Digital intelligence	Similarweb, Semrush	Traffic, search and digital demand
Consumer / social intelligence	Brandwatch and similar	Listening and audience signals
Competitive intelligence	Crayon, Klue, AlphaSense and others	Monitoring and enterprise intelligence
Startup validation	Orbis, Verdiccio, XpertVex, Preuve and others	Fast idea validation and scoring
Qualitative research	Listen Labs and similar	Customer interviews / qualitative insight

The 2026 landscape contains several strong point solutions. Examples include general research tools, competitive intelligence platforms, digital-demand tools, consumer intelligence products and startup validation products. Current sources list categories and vendors such as Similarweb, Semrush, Brandwatch, Crayon, Klue and AlphaSense, while newer startup validators emphasize fast evidence-based idea scoring.

□cite□turn0search0□turn0search2□turn0search4□turn0search9□Category

The market is competitive. Recent products already offer evidence-linked startup validation, competitor mapping, scoring, reports and monitoring.

□cite□turn0search11□turn0search14□turn0search15□turn0search17□

36. FI Differentiation

Competitor pattern	FI opportunity
One-off validation	Persistent intelligence workspace
Static report	Living market model + radar
Generic chatbot	Structured founder context + evidence graph
Competitor database	Competition connected to customer jobs and decisions
Market sizing only	Market + customer + competition + pricing + GTM + experiments
Score without transparency	Score + evidence coverage + assumptions + trace
Research without action	Research → hypothesis → experiment → decision
Tool stack fragmentation	One founder-facing intelligence workflow

Positioning: FI is not “an AI that tells you if your startup idea is good.” FI is the system that helps you continuously understand whether, why, for whom and under what conditions your business opportunity makes sense.

FI should not try to win by claiming “we have AI research too.” The differentiator is the system connecting research to founder decisions.

Positioning: FI is not “an AI that tells you if your startup idea is good.” FI is the system that helps you continuously understand whether, why, for whom and under what conditions your business opportunity makes sense.

37. Defensibility and Moat

The strongest long-term moat should come from structured longitudinal intelligence, not simply access to an LLM.

Evidence graph linking claims, sources and decisions

Founder decision memory

Historical versions of market assumptions

Experiment outcomes

Research methodology

Benchmarking across ideas and categories

Vertical intelligence

Market change history

Quality feedback loops

Proprietary aggregated patterns where privacy and consent permit

Outcome feedback: which recommendations led to useful decisions

Potential moat loop: Market evidence → Founder assumptions → Decisions → Experiments → Outcomes → Better intelligence → Better future decisions.

38. Dubai/UAE + India Strategy

Dimension	Dubai / UAE	India
Founder ecosystem	International founders, SMEs, investors, accelerators	Large startup, student and SMB ecosystem
Use case	Market entry, SME transformation, new ventures, regional expansion	Idea validation, student entrepreneurship, startups, SMB growth
Language / localization	English-first with future Arabic support	English-first with potential regional language support
Research geography	UAE + GCC + global	India + state/city + global
Go-to-market	Founder communities, innovation ecosystems, business networks	Student communities, incubators, founder communities, colleges

The product architecture should therefore support geography as a first-class research parameter rather than assuming that one market's evidence applies universally.

FI is being built by DEZAI Technologies and The First Brick Community, with Dubai/UAE and India as launch markets.

The product architecture should therefore support geography as a first-class research parameter rather than assuming that one market's evidence applies universally.

39. Launch Strategy

Stage	Objective	Core product
Private alpha	Prove research quality	Adaptive interview + research engine + evidence + report
Founder beta	Prove repeat usage	Projects + history + score + assumptions + experiments
Public launch	Build market awareness	Polished UX + pricing + exports + copilot
Intelligence expansion	Create retention	Radar + competitor monitoring + longitudinal history
Team expansion	Increase contract value	Collaboration + admin + shared workspaces

The launch message should emphasize the outcome: better decisions before expensive execution.

Launch should be staged around a narrow, exceptional core rather than releasing every planned feature at once.

The launch message should emphasize the outcome: better decisions before expensive execution.

40. Product Roadmap

Phase	Focus	Capabilities
0. Foundation	Trustworthy core	Auth, workspace, idea model, source/evidence schema, research orchestration
1. MVP	Research	Adaptive interview, market research, competitor research, customer signals, reports
2. Validation	Decision support	Opportunity score, assumptions, risks, recommendations, experiment lab
3. Intelligence	Structured memory	Evidence graph, decision trace, founder copilot, research history
4. Radar	Continuous intelligence	Competitor, customer, demand, technology and market alerts
5. Primary research	Direct evidence	Interview workflows, transcript analysis, surveys and research campaigns
6. Team / Enterprise	Scale	Collaboration, governance, integrations, security and enterprise workspaces
7. Proprietary intelligence	Moat	Benchmarks, vertical intelligence and outcome-informed models

41. Metrics and KPIs

Metric	Why it matters
Time to first useful insight	Measures how quickly FI creates real value.
Research completion rate	Measures whether the workflow is understandable and useful.
Evidence click / inspection rate	Measures trust and source engagement.
Unsupported-claim rate	Critical quality metric.
Recommendation acceptance	Measures actionability.
Experiment creation	Measures transition from research to action.
Return research rate	Measures recurring value.
Radar engagement	Measures continuous intelligence value.
Decision saves	Measures whether FI becomes part of decision-making.
Report export/share	Measures practical utility.
Research cost per project	Controls AI/search economics.
Freshness coverage	Measures how current important evidence is.

42. Risks and Mitigations

Risk	Mitigation
Hallucinated facts	Evidence-first generation, source links, claim validation
Stale research	Access dates, freshness scoring, radar
Generic reports	Adaptive research plan and structured context
False precision	Confidence and evidence coverage, not just scores
Competitor crowding	Own the full decision loop and persistent intelligence
High research cost	Model routing, caching, staged research
Founder overtrust	Explicit uncertainty, assumptions and human decision control
Privacy	Workspace isolation, encryption, permissions and deletion controls
Scope creep	Keep core promise centered on market intelligence and decisions
Bad source quality	Source hierarchy, independent corroboration and quality labels

43. Future Expansion

Primary research recruitment and interview automation

Survey creation and analysis

Voice interview analysis

Founder-to-customer research workflows

Market-specific benchmark databases

Industry-specific intelligence packs

AI-generated competitive battlecards

Opportunity portfolios

Multi-idea comparison

Founder decision simulations

Scenario planning

Expansion-market analysis

Investor and board intelligence rooms

API for incubators and innovation programs

Enterprise research workspaces

Proprietary market benchmark products

Expansion should follow one rule: every new feature must strengthen FI's core loop of evidence → understanding → decision → learning.

44. Final Product Definition

Founder Intelligence is an AI-native market intelligence and decision platform that helps founders research markets, understand customers, map competition, test assumptions and decide what to build next.

Purpose: reduce avoidable uncertainty in business building. Core problem: founders have too much fragmented information and too little structured, trustworthy decision support.

How: adaptive discovery + multi-stage research + evidence architecture + market/customer/competitive intelligence + opportunity scoring + assumptions + experiments + decision trace + continuous radar. What makes it different: FI connects market evidence to founder decisions and remembers how those decisions evolve over time.

Who builds it: DEZAI Technologies × The First Brick Community. Where it launches: Dubai/UAE + India. Long-term ambition: become the intelligence layer between a business idea and the execution of a durable company.

The ultimate FI experience should make a founder feel: “I understand my market better, I know what I still do not know, I can see why the recommendation was made, and I know exactly what to test next.”

45. External Research Notes and

Sources This section records current external context used to shape the strategic positioning. Product features described elsewhere in this document are the FI product blueprint, not claims that every capability already exists.

Shopify, 26 Jun 2026 AI market intelligence is described as ongoing tracking of customers, competitors and industry, using sources such as reviews, social posts, search trends, competitor sites and market reports. It distinguishes ongoing market intelligence from question-specific market research. [cite]turn0search0[Gartner, 2026 Competitive and market intelligence platforms consolidate internal and external information about competitors, markets and customers, including news, social media, websites, industry databases, research and financial filings.

[cite]turn0search2[turn0search4]Stack AI Kit, 7 Sep 2026 A current 2026 comparison notes that the market spans competitive intelligence, digital demand, brand analysis, buyer intent and external business data, and that no single tool covers the entire market picture. [cite]turn0search3[Current startup validators Orbis, Verdiccio, XpertVex and Preuve demonstrate that fast AI startup validation, evidence-linked reports, scoring, competitor analysis and monitoring are already competitive product categories. [cite]turn0search11[turn0search14[turn0search15[turn0search17[AI qualitative research market A September 2026 report says Salesforce is reportedly in talks to acquire Listen Labs for approximately \$2B, illustrating growing strategic interest in AI-driven customer research. The deal was reported as ongoing and not finalized.

[cite]turn0news23[Recommended principle for future research updates: competitive claims, pricing, vendor capabilities and market conditions should be re-verified before being used in external investor or customer material.

Appendix A. FI Product Principles

Evidence before confidence.

Facts, inference, assumptions and recommendations are different objects.

Every important recommendation should be traceable.

Research should reduce uncertainty, not create a longer report.

Do not confuse a signal with proof.

Do not confuse a competitor gap with customer demand.

Do not confuse market size with opportunity.

Do not confuse AI fluency with research quality.

Build for recurring intelligence, not one-time novelty.

Keep the founder in control of the final decision.

Make complexity progressive.

Design for Dubai/UAE and India from the architecture level.

Global expansion should not require rebuilding the research model.
